

## Introduction

This project is a high-end personal portfolio built with a focus on modern web design trends and technical excellence. The redesign prioritizes a "premium feel" through glassmorphism, smooth animations, and a focus on visual hierarchy.

## Technologies Used

- **React & TypeScript:** Used for creating a modular, component-based architecture.
- **Tailwind CSS:** Enabled a unified design system with utility-first maintenance.
- **EmailUS:** Integrated for seamless, backend-free contact form functionality.

## Code Structure Explanation

- **Layout Architecture:** Centralized in App.tsx with a global bg-mesh background.
- **Modular Components:** Each section (Hero, About, Projects, etc.) is an independent, reusable React component.
- **Design Tokens:** Custom CSS variables for borders, primary colors, and glass effects are defined in index.css and extended in tailwind.config.js.

## Reflection

During this redesign, I learned the importance of visual balance—how to use translucent layers and bright accents without overwhelming the user. Integrating EmailUS taught me the value of serverless integrations for lightweight portfolios. Selecting a minimal yet premium color palette was key to achieving "eye-comfort" in dark mode.
